Description

Problem Statement

Identifying the correct digital representation of a retail product can be challenging. The same product may appear across e-commerce sites, retailer catalogs, marketplaces, manufacturer pages, and other sources with different names, package sizes, languages, or promotional contexts

Search engines can provide multiple candidate URLs, but identifying the right product often requires reviewing text, product attributes, images, and other evidence. Pages may also contain incomplete or conflicting information, making the process time-consuming and prone to incorrect matches.

The build expected from participants

Design an AI-powered **Product Truth Agent** that evaluates multiple candidate webpages and identifies the most likely digital representation of a given product.

Expected Outcomes

The proposed solution should be able to:

- Analyze evidence across candidate webpages.
- Compare product descriptions, attributes, and images.
- Identify and eliminate false matches.
- Resolve incomplete or conflicting information.
- Select the most likely product URL.

Register Team

- Explain the reasoning behind the selection.
- Demonstrate the solution on sample products and candidate webpages.

Success Criteria

- Accurately identify the most likely product URL.
- Distinguish the correct product from similar or misleading matches.
- Provide clear and transparent reasoning.
- Go beyond keyword matching by effectively using available evidence

Environment / Infra Requirement

- Participants may use LLMs, multimodal models, ML/NLP techniques, or hybrid approaches.
- Access to an LLM will be provided, where applicable.
- The solution should be demonstrable as a working prototype.

Specific Data Set Requirement

The dataset will include:

- Product description
- Barcode information
- Retailer
- Category
- Country
- A set of candidate webpages with extracted content and metadata
-

The goal is to build a solution that can reason like a human product researcher when identifying the true digital identity of a product.
